

Solution of conducted emission measurement

◇By using spectrum analyzer for EMI, Conducted emission measurement is realized easily and at a low price.

[~*Application*~]

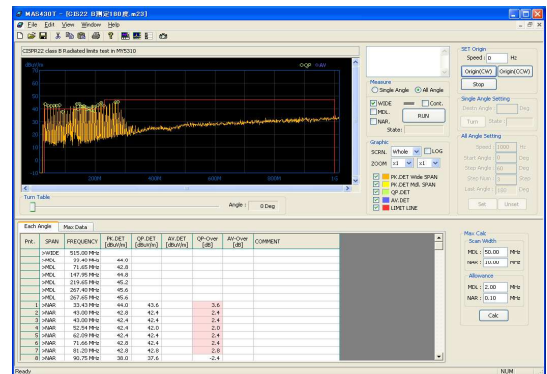

[~*Solution*~]

■ The spectrum analyzer for EMI/MSA338E is equipped with QP·AV detection modes and 9kHz·120kHz[6dB] RBW which are the most suitable spec for the EMI measurement.

This EMI test system focuses on being used to solve the problem in advance and reducing the running costs drastically such as time for measures and test number at formal site.

■ The software only for the EMI measurement/MAS430 enables the necessary parameters at bandwidth and threshold level etc. to be automatically set by specifying EMI standard such as CISPR11,22, EN55011,22, FCC port 15, VCCI etc..

Sample by PC software for EMI(MAS430)

■ And the source of the emission noise can be found by using a magnetic field probe/CP-2SA of option and measuring the magnetic field on the print circuit board. Furthermore, the addition of anechoic box to the system enables the radiated emission test.

[~*System constitution & Price*~]

- The following enables the EMI measurement to be realized easily and at a low price.
 - ① Spectrum analyzer for EMI (MSA438E) ×1
 - Lithium-ion battery (MB400) ×1
 - ② PC software for EMI (MAS430) ×1
 - USB cable (MI400) ×1
 - ③ LISN (MPW201B) ×1
 - SMA→BNC cable for LISN (MC102) ×1
 - N→SMA adapter (MA306) ×1
 - Insulation transformer ×1
 - ④ Magnetic field probe (CP-2S) ×1

※PC and ground plate for LISN are not included in this configuration.
